

Let's make some updates to the website

1. Let's create the backend components for the forms we've created
2. About the book/template, I want the document to be automatically downloaded to the user's device once they click the get toolkit button. I want to link the book from my google drive to this button, such that when users click the "get toolkit" button on my website, the book is downloaded to them (advise if this is a good way to follow and/or suggest an optimised way of doing this)
3. Let's create more articles, to show the visionary leaders perspectives on subjects matters such as
 - prioritising people over process
 - Managing diverse stakeholders
 - Ethical AI development, encouraging inclusive and diverse data modelling, as a means to reduce bias and encourage fairness and inclusivity
 - Tips for scalable AI-prompt development for no-code low-code individuals.
4. Let's create the main blog pages (where users read the article's contents). What this means is that you'd be developing the articles for topics you have previously suggested, and the new ones you included in 3 above (to do this, I want you to think and write creatively. The goal is to keep readers enthused, engaged and wanting to read to the end). See list of topics you already suggested
 - **The Paradox of the Generalist AI**
 - **Scaling the Unscalable: Principles of Decentralized Platforms**
 - **Measuring Developer Happiness as a Core Metric**
5. Let's play around some fonts. Change the font-family to Hanken Grotesk, sans-serif;
6. Add 2 more case studies to the portfolio section and label them accordingly (initial labels you have are success stories and learning experience). These new casestudies should reflect
 - Negotiating with stakeholders
 - Developing products from the end-user's perspective
7. The footer section:
 - Close the margin gap between "Navigate" and "resources", and move them closer to the right hand side
 - remove the newsletter form completely and replace it with get in touch: my email e.g hello@olanozun.com

Prompt 2 for backend integration to production

Next Steps for Production:

1. Add rate limiting to prevent spam
2. Add email integration (Nodemailer, Resend, etc.)
3. Add CAPTCHA for bot protection
4. Store submissions in a database
5. Set up email notifications for new submissions
